

Case Study

Digital Media

Video Hosting and Streaming: **Ngee Ann Polytechnic**

Overview

Ngee Ann Polytechnic (NP), together with EVVO, are working together to design an online video portal to allow for different schools and departments within the polytechnic to have their own video library in which to manage their digital content. The scope of work encompasses the following;

1. VHSP portal development (With LDAP integration)
2. Storage as a service (Hosting)
3. Content Delivery Network (CDN) Link Up

The portal is designed to function as digital video content management, which is to allow and encourage lecturers and students to easily upload and share videos showcasing stories and concepts, within the safe, secure environment.

All contents or data are to be stored at secured hosting environment with all security measures to be in place, plus enhanced streaming functions and capabilities to allow mass upload of video contents in a fast and efficient manner

Solution

Each school/department using the VHSP will be given access to the system via LDAP; the resource allocated for said entities can be pre-assigned to ensure that the resources are kept within control of the Polytechnics. NP can also decide to increase the allocation of resources if the demand increases. Once both parties had decided on all aspects, EVVO commenced the design and development work, such as:

1. EVVO UI designer provisioned final site design, approved by NP department heads.
2. EVVO Security team proposed security setup on infrastructure and cloud solution for hosting and streaming facilities
3. EVVO development team worked on the streaming features and requirements according to NP's needs and requirements, include incorporating CDN services for speedy content delivery securely.

The project completed successfully as per stipulated schedule.
